

CCNA Day 43

FTP & TFTP

| | | |
|-----------------------------------------------------------------------------------------------------------------------------------|-----|---|
| 1.0 Network Fundamentals | 20% | ▼ |
| 2.0 Network Access | 20% | ▼ |
| 3.0 IP Connectivity | 25% | ▼ |
| 4.0 IP Services | 10% | ▲ |
| 4.1 Configure and verify inside source NAT using static and pools | | |
| 4.2 Configure and verify NTP operating in a client and server mode | | |
| 4.3 Explain the role of DHCP and DNS within the network | | |
| 4.4 Explain the function of SNMP in network operations | | |
| 4.5 Describe the use of syslog features including facilities and levels | | |
| 4.6 Configure and verify DHCP client and relay | | |
| 4.7 Explain the forwarding per-hop behavior (PHB) for QoS such as classification, marking, queuing, congestion, policing, shaping | | |
| 4.8 Configure network devices for remote access using SSH | | |
| 4.9 Describe the capabilities and function of TFTP/FTP in the network | | |
| 5.0 Security Fundamentals | 15% | ▼ |
| 6.0 Automation and Programmability | 10% | ▼ |

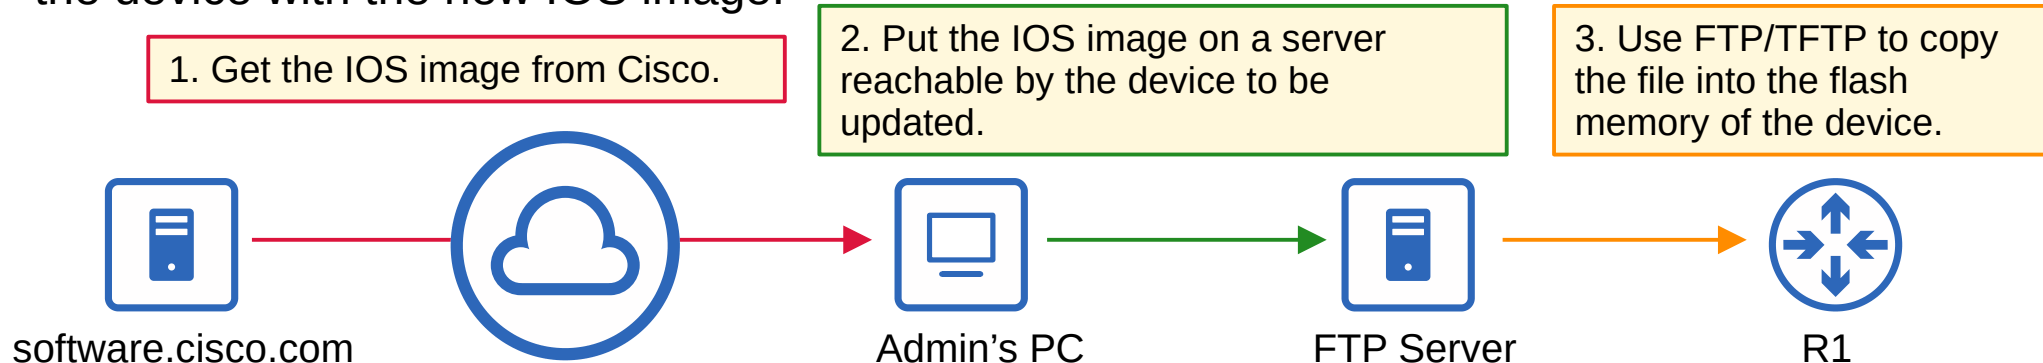

Things we'll cover

- The purpose of FTP/TFTP
- FTP/TFTP functions & differences
- IOS File Systems
- Using FTP/TFTP in IOS

FTP & TFTP

- FTP (File Transfer Protocol) and TFTP (Trivial File Transfer Protocol) are industry standard protocols used to transfer files over a network.
- They both use a client-server model.
 - Clients can use FTP or TFTP to copy files from a server.
 - Clients can use FTP or TFTP to copy files to a server.
- As a network engineer, the most common use for FTP/TFTP is in the process of upgrading the operating system of a network device.
- You can use FTP/TFTP to download the newer version of IOS from a server, and then reboot the device with the new IOS image.

Trivial File Transfer Protocol

- TFTP was first standardized in 1981.
- Named 'Trivial' because it is simple and has only basic features compared to FTP.
 - Only allows a client to copy a file to or from a server.
- Was released after FTP, but is not a replacement for FTP. It is another tool to use when lightweight simplicity is more important than functionality.
- No authentication (username/PW), so servers will respond to all TFTP requests.
- No encryption, so all data is sent in plain text.
- Best used in a controlled environment to transfer small files quickly.
- TFTP servers listen on **UDP port 69**.
- UDP is connectionless and doesn't provide reliability with retransmissions.
- However, TFTP has similar built-in features within the protocol itself.

TFTP Reliability

- Every TFTP data message is acknowledged.
 - If the client is transferring a file to the server, the server will send Ack messages.
 - If the server is transferring a file to the client, the client will send Ack messages.
- Timers are used, and if an expected message isn't received in time, the waiting device will re-send its previous message.

TFTP uses 'lock-step' communication. The client and server alternately send a message and then wait for a reply. (+retransmissions are sent as needed)

- [illegible]

TFTP TID

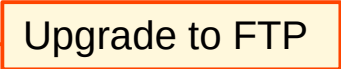

- When the client sends the first message to the server, the destination port is UDP 69 and the source is a random ephemeral port.
- This random port is called a 'Transfer Identifier' (TID) and identifies the data transfer.
- The server then also selects a random TID to use as the source port when it replies, **not 69**.
- When the client sends the next message, the destination port will be the server's TID, **not 69**.

*This is beyond the scope of the CCNA, but is an interesting part of TFTP's operation.

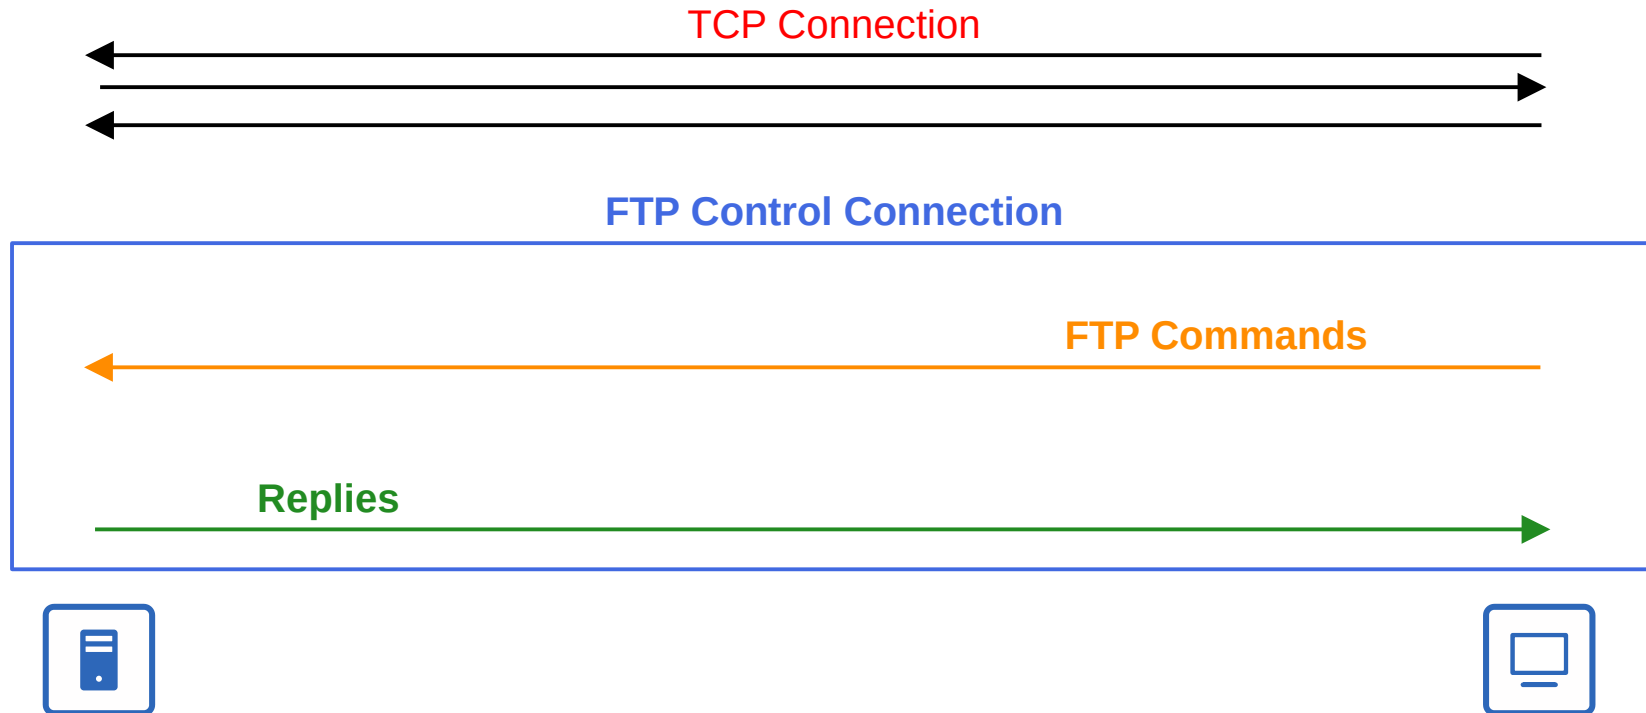

File Transfer Protocol

- FTP was first standardized in 1971.
- FTP uses **TCP ports 20 and 21**.
- Usernames and passwords are used for authentication, however there is no encryption.
- For greater security, FTPS (FTP over SSL/TLS) can be used.  
- SSH File Transfer Protocol (SFTP) can also be used for greater security.  
- FTP is more complex than TFTP and allows not only file transfers, but clients can also navigate file directories, add and remove directories, list files, etc.
- The client sends *FTP commands* to the server to perform these functions.

https://en.wikipedia.org/wiki/List_of_FTP_commands

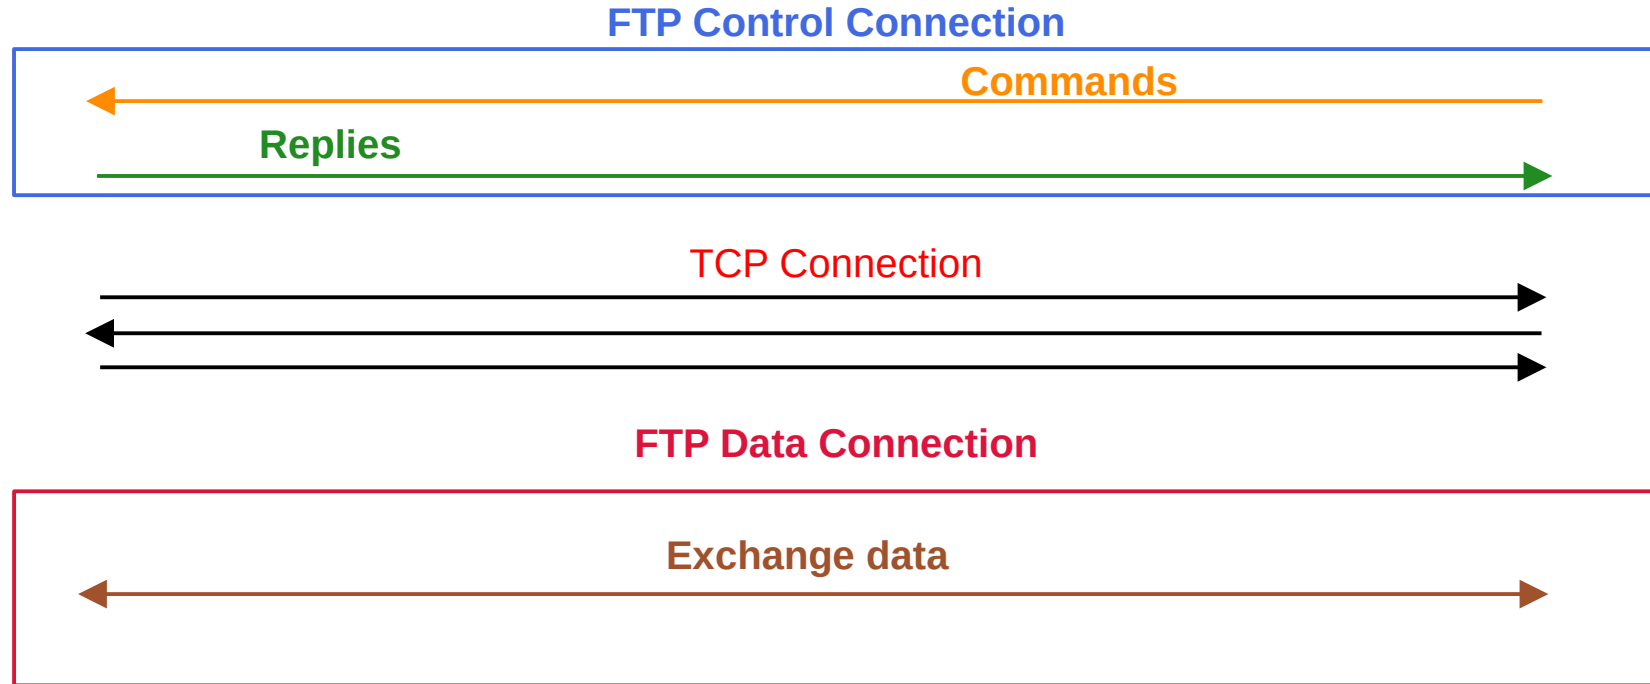

FTP Control Connections

- FTP uses two types of connections:
 - An **FTP control** connection (**TCP 21**) is established and used to send FTP commands and replies.
 - When files or data are to be transferred, separate **FTP data** (**TCP 20**) connections are established and terminated as needed.

Active Mode FTP Data Connections

- The default method of establishing FTP data connections is **active mode**, in which the server initiates the TCP connection.

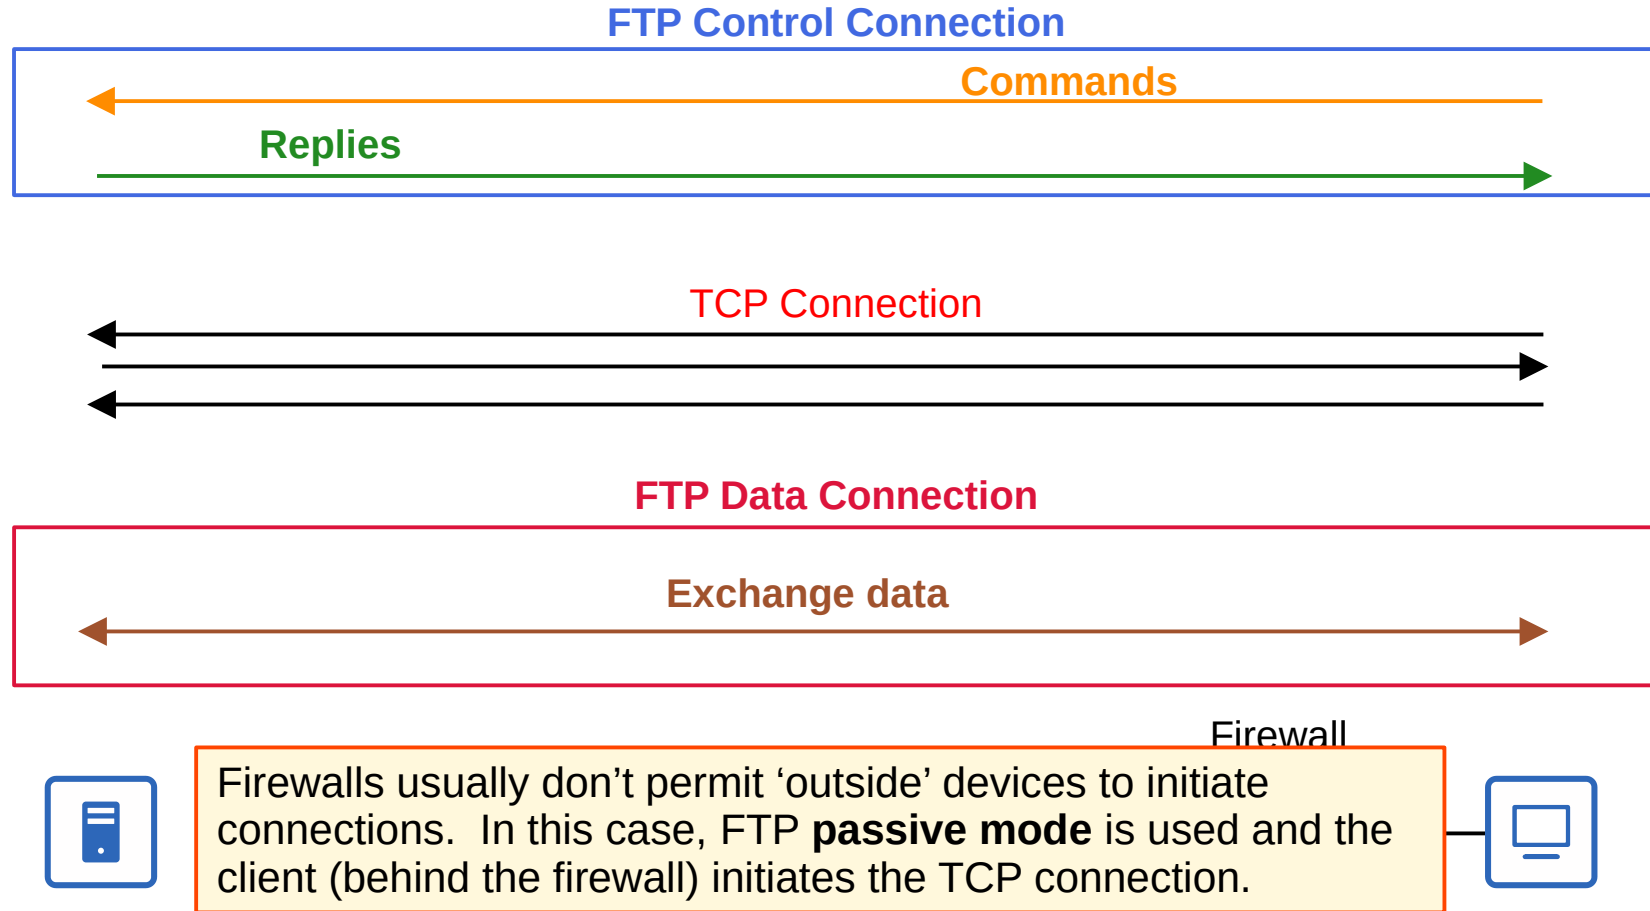

In FTP **active mode**, the server initiates the data connection.

Passive Mode FTP Data Connections

- In FTP **passive mode**, the client initiates the data connection. This is often necessary when the client is behind a firewall, which could block the incoming connection from the server.

FTP

- Uses TCP (20 for data, 21 for control) for connection-based communication
- Clients can use FTP commands to perform various actions, not just copy files
- Username/PW authentication
- More complex

TFTP

- Uses UDP (69) for connectionless communication (although a basic form of 'connection' is used within the protocol itself)
- Clients can only copy files to or from the server
- No authentication
- Simpler

IOS File Systems

- A file system is a way of controlling how data is stored and retrieved.
- You can view the file systems of a Cisco IOS device with **show file systems**

```
Router#show file systems
File Systems:
```

| | Size(b) | Free(b) | Type | Flags | Prefixes |
|---|------------|------------|---------|-------|-----------------|
| * | 2142715904 | 1994403840 | disk | rw | flash0: flash:# |
| | - | - | disk | rw | flash1: |
| | 966656 | 962560 | disk | rw | flash2:# |
| | - | - | disk | rw | flash3: |
| | - | - | opaque | rw | archive: |
| | - | - | opaque | rw | system: |
| | 262144 | 256791 | nvr | rw | nvr |
| | - | - | opaque | rw | tmpsys: |
| | - | - | network | rw | snmp: |
| | - | - | opaque | rw | null: |
| | - | - | network | rw | tftp: |
| | - | - | opaque | ro | xmodem: |
| | - | - | opaque | ro | ymodem: |
| | - | - | opaque | wo | syslog: |
| | - | - | network | rw | rcp: |
| | - | - | network | rw | pram: |
| | - | - | network | rw | ftp: |

disk: Storage devices such as flash memory.

opaque: Used for internal functions

nvr: Internal NVRAM. The startup-config file is stored here.

network: Represents external file systems, for example external FTP/TFTP servers.

[output omitted]

Upgrading Cisco IOS

- You can view the current version of IOS with **show version**

```
R1#show version
Cisco IOS Software, C2900 Software (C2900-UNIVERSALK9-M), Version 15.1(4)M4, RELEASE SOFTWARE (fc2)
Technical Support: http://www.cisco.com/techsupport
Copyright (c) 1986-2012 by Cisco Systems, Inc.
Compiled Thurs 5-Jan-12 15:41 by pt_team
[output omitted]
```

- You can view the contents of flash with **show flash**

```
R1#show flash
System flash directory:
File      Length    Name/status
  3    33591768  c2900-universalk9-mz.SPA.151-4.M4.bin
  2     28282   sigdef-category.xml
  1     227537   sigdef-default.xml
[33847587 bytes used, 221896413 available, 255744000 total]
249856K bytes of processor board System flash (Read/Write)
```

33591768 bytes copied in 4.01 secs (879550 bytes/sec)

Enter the name you want
to save it as on flash (hit
enter to accept the default)

Upgrading Cisco IOS

```
R1#show flash
```

System flash directory:

| File | Length | Name/status |
|------|----------|----------------------------------------|
| 3 | 33591768 | c2900-universalk9-mz.SPA.151-4.M4.bin |
| 4 | 33591768 | c2900-universalk9-mz.SPA.155-3.M4a.bin |
| 2 | 28282 | sigdef-category.xml |
| 1 | 227537 | sigdef-default.xml |

[67439355 bytes used, 188304645 available, 255744000 total]

249856K bytes of processor board System flash (Read/Write)

boot system *filepath*

*If you don't use this command, the router will use the first IOS file it finds in flash

```
R1#conf t
```

Enter configuration commands, one per line. End with CNTL/Z.

```
R1(config)#boot system flash:c2900-universalk9-mz.SPA.155-3.M4a.bin
```

```
R1(config)#exit
```

```
R1#write memory
```

Building configuration...

[OK]

```
R1#reload
```

Proceed with reload? [confirm]

Upgrading Cisco IOS

```
R1#show version
Cisco IOS Software, C2900 Software (C2900-UNIVERSALK9-M), Version 15.5(3)M4a, RELEASE SOFTWARE(fc1)
[output omitted]
```

```
R1#delete flash:c2900-universalk9-mz.SPA.151-4.M4.bin
Delete filename [c2900-universalk9-mz.SPA.151-4.M4.bin]?
Delete flash:/c2900-universalk9-mz.SPA.151-4.M4.bin? [confirm]
```

delete filepath

```
R1#show flash
```

```
System flash directory:
File   Length   Name/status
  4    33591768 c2900-universalk9-mz.SPA.155-3.M4a.bin
  2     28282  sigdef-category.xml
  1     227537  sigdef-default.xml
```

```
[33847587 bytes used, 221896413 available, 255744000 total]
249856K bytes of processor board System flash (Read/Write)
```

Copying Files (FTP)

```
R1(config)#ip ftp username cisco
R1(config)#ip ftp password cisco
R1(config)#exit
```

Configure the FTP username/password that the device will use when connecting to an FTP server.

```
R1#copy ftp: flash:
Address or name of remote host []? 192.168.1.1
Source filename []? c2900-universalk9-mz.SPA.155-3.M4a.bin
Destination filename [c2900-universalk9-mz.SPA.155-3.M4a.bin]?
```

```
Accessing ftp://192.168.1.1/c2900-universalk9-mz.SPA.155-3.M4a.bin...
Loading c2900-universalk9-mz.SPA.155-3.M4a.bin from
192.168.1.1: !!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
[output omitted]
```

```
R1# show file systems
```

```
R1# show version
```

```
R1# show flash
```

```
R1# copy source destination
```

```
R1(config)# boot system filepath
```

```
R1(config)# ip ftp username username
```

```
R1(config)# ip ftp password password
```

Things we covered

- The purpose of FTP/TFTP
- FTP/TFTP functions & differences
- IOS File Systems
- Using FTP/TFTP in IOS

Which of the following statements about FTP are true? (select two)

- a) FTP control connections use TCP port 20.
- b) FTP control connections use TCP port 21.
- c) FTP control connections use TCP port 69.
- d) FTP data connections use TCP port 20.
- e) FTP data connections use TCP port 21.
- f) FTP data connections use TCP port 69.

Which of the following commands can be used to transfer a file from an external TFTP server to the local device's flash storage?

- a) **copy tftp: flash:**
- b) **copy flash: tftp:**
- c) **move tftp: flash:**
- d) **move flash: tftp:**

R1 is behind a firewall and wants to connect to an external FTP server. Which of the following statements is true?

- a) R1 should use FTP passive mode for the control connection.
- b) R1 should use FTP active mode for the control connection.
- c) R1 should use FTP passive mode for the data connection.
- d) R1 should use FTP active mode for the data connection.

Which type of file system is used to store the startup-config of a device running Cisco IOS?

- a) Opaque
- b) Disk
- c) Network
- d) NVRAM

Which of the following functions are NOT possible when using TFTP? (select two)

- a) Copy a file from a server.
- b) Create a new directory on a server.
- c) List the contents of a server.
- d) Copy a file to a server.
